

Added Value for Cisco IP-Telephony

TOPCALL CTI - telephone from Outlook made easy

Feature Overview

Enhanced Connectivity

- Native Exchange Integration
- Caller Identification
- Telephone Journals
- Click-to-dial
- Call Reminders
- Call Transfer / Accept
- Telephone Message integration
- Presence Manager

Incoming telephone call

The Caller Identification for all incoming calls is displayed in the Microsoft Outlook and Microsoft Exchange clients. Since the standard address book for Microsoft Outlook is automatically opened and ready to fill in, users are able to better prepare for telephone conversations and effectively manage incoming calls.

TC/Snapware displays the caller data in an Outlook pop-up window. If the caller can not be identified from the directory, TC/Snapware automatically opens a new Outlook contact window with the unknown telephone number already filled in. Users can directly enter the missing customer data so that it will be available for the next time the customer calls.

Outgoing phone calls

Users can easily start a telephone call from the Microsoft Outlook address book by selecting the respective person and pressing the Snapware telephony "Dial" button. TC/Snapware provides a

list of all available telephone numbers for the person and users can start the phone call with a simple mouse click. Consequently, users save time and minimise calls to misdialled numbers. Any information received during the conversation is directly entered in the Outlook contact form and available to all users for future phone calls with the customer.

The list box displays all available telephone numbers for each contact. Users can individually select how to reach the person. By pressing "Dial", the call is initiated.

Added Value for Cisco IP-Telephony

TOPCALL CTI - telephone from Outlook made easy

Telephone messages

When a colleague is away from his desk, taking messages is easy. TC/Snapware automatically generates a telephone message with the relevant caller information already filled in. Users can additionally add background information that is included alongside the number and the caller information. The message is then sent as a standard Microsoft email. Information is transferred to the target person faster and more precise. The intuitive user interface increases employees willingness to take over phone calls for their colleagues, making it easy to perform once complicated functions.

TC/Snapware Journal

TC/Snapware provides users with a journal in Microsoft Outlook which registers all incoming and outgoing telephone calls. All successful and unsuccessful telephone calls are logged onto the server, regardless whether the PC is turned on or off. Each entry gives detailed information concerning the handling of the phone call:

Eintragstyp	Betreff	Beginn	DaUER	Kontakt	Kategorien

who was called, who picked up the call, what time the person called and how long the connection lasted. Callbacks and call scheduling can be directly initiated from the journal. The continuous logging function helps to trace every call or to generate callback lists. The registry files show who called during the user's absence so that priorities can be set for callback. Users can easily generate lists to get a quick overview of call histories.
