

TOPCALL HARDWARE GENERAL BENEFITS

Overview:

The new TOPCALL servers are key components of TOPCALL's turnkey solutions combining state of the art hardware with fault tolerant components. These servers are specifically designed for optimized communications and messaging.

Why TOPCALL Hardware?

There are clear advantages of using TOPCALL servers. While TOPCALL software will run on 3rd party systems we have learned from experience that true value is obtained from a turnkey solution of TOPCALL communication servers and applications.

→ THE KEY ADVANTAGES ARE THAT:

- TOPCALL configures the servers and tests all components prior to delivery and installation.
- TOPCALL has a unique additional hardware "watch-dog" for automatic reboot. This provides a level of security beyond that of a typical software "watchdog".
- As the servers are designed in-house specifically for communications and messaging TOPCALL can guaranty the compatibility of all drivers.
- The customer does not have to deal with the "multiple problem escalation procedures" of different software and hardware vendors. TOPCALL takes full responsibility.
- The hardware is specifically designed for communications and messaging and not for "generic" use. Therefore communications and messaging performance is enhanced compared to 3rd party hardware.

The key benefit for many of our customers is that with a TOPCALL turnkey solution they never have any problems with support or service.
